

Technology

I am very interested in my technology discipline which would be data science just for the simple fact that data is ever changing and so is technology and so I wanted to be involved in something that has the ability to grow. Which not only does it have the ability to grow, but I could have the ability of being the very reason in which it can grow. I think that technology drives society. The reason I think this is because we create a technology that is super interesting and everyone is satisfied for a moment, but then our minds get to thinking what will we be able to create next that will be amazing. Maybe society use to drive technology, but now in 2022, I believe that technology is what helps the society to keep being driven. I don't really think that it is possible to live a lifestyle without technology. This would depend on what we are considering to be technology of course, because in retrospect technology could have been a stick to cavemen, but when we think of technology, we think of computers, phones, etc... We have always used technology because it is just applied knowledge and everything that you touch is really some sort of technology, this even could be a water bottle. After the data-driven era which we are currently in, I think that the next era will be an AI era in regards to technology. AI has become more popular and used more and more as the years pass and so if any era is able to be predicted, I would assume this would be the next one or pretty similar to what it would end up being.
